The incidence of fumonisin C 1 in moldy corn was 71%; the incidence was 11% for fumonisin C 3 and 43% for fumonisin C 4. Their mean levels ranged from 500 to 1,900 ng/g. This is the first report on the natural occurrence of the C series of fumonisin and fumonisin B 4 in moldy corn.

Of these, fumonisin B 1 (FB 1), fumonisin B 2 (FB 2), and fumonisin B 3 (FB 3) are the major fumonisin produced in nature. The most prevalent of these mycotoxins in contaminated corn is FB 1 ...

Guidance for Industry: Fumonisin Levels in Human Foods and ...

As shown in Table 3, increased exposure to fumonisin, based on postpartum sa:so ratio, was associated with an increased NTD occurrence except for the highest exposure category. The highest exposure category (sa:so > 0.35) was related to less frequent occurrence (OR = 0.7, 95% CI, 0.2-2.9) but was based on the fewest number of subjects and ...

Finally, reducing insect damage and fungal diseases reduced fumonisin levels in corn. In general the occurrence rates and levels of fumonisin have been lower in human food than crops. In foods, the use of alkaline solutions, below quantity of water and high temperature reduced the occurrence of fumonisin in these commodities.

Overview of the worldwide occurrence (%) and median levels of fumonisin ($\mu\text{g}/\text{kg}$) in feeds. Values refer to the sum of FB1 and FB2. Crossed circles represent cases of human esophageal and liver cancers which have been linked to fumonisin exposure. In these regions, maize consumption and/or fumonisin levels in maize are above the average (Table 3).

amounts of bound fumonisin may be present in raw maize, but commonly used analytical methods are not able to measure their occurrence. To estimate fumonisin exposure in humans, biomarkers are increasingly being used. Urinary FB 1 (UFB 1) is the most commonly used biomarker; it has been used to evaluate the effectiveness of dietary interventions

February 2018 - WHO

Since the discovery of the fumonisin in 1988, extensive academic studies have generated much knowledge, including data on chemistry, biochemistry, toxicology, methods of analysis, natural occurrence in food supplies, fate during various processing procedures, and human and animal exposures.

Fumonisin can be separated into four main groups, identified as the fumonisin A, B, C, and P series ; the B group includes the most active fumonisin FB 1 and its isomers FB 2, FB 3 and FB 4 . In particular, FB 1 , which causes considerable toxicological concern, is the most abundant fumonisin produced in maize.

In rice, fumonisin have been found to be present where sheath rot disease is present. Grains should be harvested without kernel damage, screened and dried to a level of moisture suitable for storage (<14%). Conditions favorable to mold growth likely will cause the further formation of fumonisin in storage.

What is Fumonisin? - Romer Labs

The best available strategies for reducing the risk of fumonisin contents of maize are to ensure that hybrids are adapted to the environment and to limit drought stress and insect herbivory. It may also be necessary to make use of alternative strategies such as producing hybrids that contain enzymes to degrade fumonisin as it is produced.

Factors that affect the occurrence of fumonisin ...

The lack and poor accessibility of effective and environmentally safe control methods have led to an increased interest in practical and biological alternatives to reduce fumonisin intake. These include the application of natural resources, including plants, microbial cultures, genetic material thereof, or clay minerals pre- and post-harvest.

of roughly 16-20%. With fumonisin, the highest levels were seen with 20% moisture, and production (as well as fungal growth) ceased at less than 18%. In one study of *F. verticillioides*, the fungus was detected in corn 4-5 weeks after flowering, and fumonisin was detected one week after appearance of the fungus.

Understanding Fumonisin Contamination of Corn

In developed countries an integrated approach, involving good agricultural management practices, hazard analysis and critical control point (HACCP) production, and storage management, together with selected biologically based treatments, mild chemical and physical treatments could reduce fumonisin contamination effectively.
