Mechanics of materials: a modern integration of mechanics and materials in structural design. Christopher Jenkins, Sanjeev Khanna. This book is the first to bridge the often disparate bodies of knowledge now known as applied mechanics and materials science. Using a very methodological process to introduce mechanics, materials, and design issues in a manner called "total structural design", this book seeks a solution in "total design space" Features include: \* A generalized design template ...

Analysis or design problems in the mechanics of materials generally involve two major areas: • Determination of the internal forces set up within the material by loads or displacements imposed on it; this is a largely mathematical undertaking, termed stress analysis. These internal forces are often independent of the choice of material used in the structure, and it is often possible to carry out this analysis without much specific knowledge of the material itself.
