Positron Emission Tomography With Computed

What is Positron Emission Tomography - Computed Tomography (PET/CT) Scanning? Positron emission tomography, also called PET imaging or a PET scan, is a type of nuclear medicine imaging. Nuclear medicine imaging uses small amounts of radioactive material to diagnose, evaluate or treat a variety of diseases. These include many types of cancers, heart disease, gastrointestinal, endocrine or neurological disorders and other abnormalities.

PET/CT - Positron Emission Tomography/Computed Tomography

Aim: Functional and molecular imaging, including positron emission tomography with computed tomography imaging (PET/CT) is increasing for radiotherapy (RT) definition of the target volume. This expert review summarizes existing data of functional imaging modalities and RT management, in terms of target volume delineation, for the following anatomical districts: brain (for primary and secondary ...

Positron emission tomography with computed tomography ...

Positron emission tomography-computed tomography (better known as PET-CT or PET/CT) is a nuclear medicine technique which combines, in a single gantry, a positron emission tomography (PET) scanner and an x-ray computed tomography (CT) scanner, to acquire sequential images from both devices in the same session, which are combined into a single superposed (co-registered) image.

PET-CT - Wikipedia

A positron emission tomography scan is known as a PET scan. PET scan is a type of test that may be used in cancer treatment. It can be done along with a CT scan. If so, doctors call it a PET-CT scan.

Abstract. Background: The objective of this study was to clarify the clinical features of pulmonary cryptococcosis using chest computed tomography (CT) and positron emission tomography with [18 F]fluoro-2-deoxy-d-glucose (FDG-PET), with a view to developing appropriate treatment. Methods: We analyzed the clinical features, and chest CT and FDG-PET characteristics of six cases of pulmonary ...

Single photon emission computed tomography/computed tomography (SPECT/CT) and positron emission tomography/computed tomography (PET/CT) units can perform both exams at the same time. PET/MRI is an emerging imaging technology. However, it is not universally available at this time. A PET scan measures important body functions, such as metabolism.

Positron Emission Tomography - Computed Tomography (PET/CT)

PET scans of the brain for Alzheimer's disease A positron emission tomography (PET) scan is an imaging test that helps reveal how your tissues and organs are functioning. A PET scan uses a radioactive drug (tracer) to show this activity. This scan can sometimes detect disease before it shows up on other imaging tests.

Alternative methods of medical imaging include single-photon emission computed tomography (SPECT), x-ray computed tomography (CT), magnetic resonance imaging (MRI) and functional magnetic resonance imaging (fMRI), and ultrasound. SPECT is an imaging technique similar to PET that uses radioligands to detect molecules in the body.
