SpectreRF is designed to handle the type of state associated with ordinary differential equations. However, Verilog-A introduces a new type of state, the state associated with local state variables, and because SpectreRF is not set up to handle this new type of state, Verilog-A hides it from SpectreRF. Such state is referred to as hidden state.

In SpectreRF, a PLL circuit is partitioned as a PFD block and a VCO block since they have different work frequencies (Other blocks such as CP, LPF and DIVIDER are being merged in those two blocks). 2.
